

# Statement on API Callouts

---

FSC Readiness Scanner 0.5.0 (04tfn000005ucSjAAI) — Atlas Advisory LLC — chase@atlasys.io

FSC Readiness Scanner makes **no API callouts of any kind**. Sample HTTP requests and responses are therefore not applicable to this submission.

Specifically, the package contains:

- No `Http`, `HttpRequest`, or `HttpResponse` usage in any Apex class
- No `@future(callout=true)` methods and no `Database.AllowsCallouts` implementations
- No Named Credentials, External Credentials, or Remote Site Settings
- No Connected Apps or External Client Apps
- No External Services, Platform Events to external systems, or Streaming API consumers
- No `fetch / XMLHttpRequest` network calls in the Lightning Web Component; the UI communicates exclusively with the packaged Apex controller via the standard Lightning wire/imperative Apex mechanism

All processing, storage, and presentation occur entirely within the subscriber's Salesforce org. This is a deliberate design decision for the product's compliance-sensitive financial-services audience: metadata never leaves the org.
